

Contractor Newsflash

Rainy Season Reminder

September 16, 2026

The rainy season is upon us.

This is a reminder to all contractors to ensure that construction sites are properly maintained and remain in compliance with City of Palm Coast erosion and sediment control requirements.

Please remember that a well-installed and maintained silt fence is the best erosion control measure and may need to be installed if other measures are not functioning properly.

Erosion Control

- Install and maintain erosion control BMPs before and during construction.
- Keep all sediment contained on-site.
- Maintain silt fences in good working order.
- Use stabilized construction entrances to prevent dirt from being tracked onto roads.
- Repair damaged or ineffective erosion control measures immediately.
- Prevent sediment from entering public rights-of-way, waterways, neighboring properties, swales, or stormwater systems. Protect storm drain inlets from sediment intrusion.

Swales /Drainage

- Keep front swales open and unobstructed to allow proper stormwater flow.
- Ensure temporary drainage pipes are functioning properly and free of debris and obstructions.
- Locate dumpsters and portable toilets outside the City right-of-way.

- Keep construction sites compliant with City standards and stormwater regulations.

Regular inspections and maintenance are essential during periods of heavy rainfall. Please address any deficiencies promptly to help prevent flooding, erosion, and water quality issues.

Thank you for your cooperation and commitment to maintaining safe and compliant construction sites.
